## GEM-DISUBSTITUTED AZACYCLIC TACHYKININ ANTAGONISTS

This invention relates to a class of azacyclic compounds, which are  
5 useful as tachykinin antagonists. More particularly, the compounds of the  
invention comprise an azacyclic ring system substituted by an arylmethoxy  
or arylmethylthio moiety.

The tachykinins are a group of naturally occurring peptides found  
widely distributed throughout mammalian tissues, both within the central  
10 nervous system and in peripheral nervous and circulatory systems.

The tachykinins are distinguished by a conserved carboxyl-terminal  
sequence:

At present, there are three known mammalian tachykinins referred to  
15 as substance P, neurokinin A (NKA, substance K, neuromedin L) and  
neurokinin B (NKB, neuromedin K) (for review see J.E. Maggio, *Peptides*  
(1985) 6(suppl. 3), 237-242). The current nomenclature designates the three  
tachykinin receptors mediating the biological actions of substance P, NKA  
and NKB as the NK<sub>1</sub>, NK<sub>2</sub> and NK<sub>3</sub> receptors, respectively.

20 Evidence for the usefulness of tachykinin receptor antagonists in pain,  
headache, especially migraine, Alzheimer's disease, multiple sclerosis,  
attenuation of morphine withdrawal, cardiovascular changes, oedema, such  
as oedema caused by thermal injury, chronic inflammatory diseases such as  
rheumatoid arthritis, asthma/bronchial hyperreactivity and other respiratory  
25 diseases including allergic rhinitis, inflammatory diseases of the gut including  
ulcerative colitis and Crohn's disease, ocular injury and ocular inflammatory  
diseases, proliferative vitreoretinopathy, irritable bowel syndrome and  
disorders of bladder function including cystitis and bladder detrusor hyper-  
reflexia is reviewed in "Tachykinin Receptors and Tachykinin Receptor

Antagonists", C.A. Maggi, R. Patacchini, P. Rovero and A. Giachetti, *J. Auton. Pharmacol.* (1993) 13, 23-93.

For instance, substance P is believed inter alia to be involved in the neurotransmission of pain sensations [Otsuka *et al*, "Role of Substance P as a Sensory Transmitter in Spinal Cord and Sympathetic Ganglia" in 1982 *Substance P in the Nervous System*, Ciba Foundation Symposium 91, 13-34 (published by Pitman) and Otsuka and Yanagisawa, "Does Substance P Act as a Pain Transmitter?" *TIPS* (1987) 8, 506-510], specifically in the transmission of pain in migraine (B.E.B. Sandberg *et al*, *J. Med Chem*, (1982) 25, 1009) and in arthritis [Levine *et al Science* (1984) 226, 547-549].

Tachykinins have also been implicated in gastrointestinal (GI) disorders and diseases of the GI tract such as inflammatory bowel disease [Mantyh *et al Neuroscience* (1988) 25(3), 817-37 and D. Regoli in "*Trends in Cluster Headache*" Ed. Sicuteri *et al* Elsevier Scientific Publishers, Amsterdam (1987) page 85)] and emesis [F. D. Tattersall *et al, Eur. J. Pharmacol.*, (1993) 250, R5-R6]. It is also hypothesised that there is a neurogenic mechanism for arthritis in which substance P may play a role [Kidd *et al* "A Neurogenic Mechanism for Symmetrical Arthritis" in *The Lancet*, 11 November 1989 and Grönblad *et al*, "Neuropeptides in Synovium of Patients with Rheumatoid Arthritis and Osteoarthritis" in *J. Rheumatol.* (1988) 15(12), 1807-10]. Therefore, substance P is believed to be involved in the inflammatory response in diseases such as rheumatoid arthritis and osteoarthritis, and fibrositis [O'Byrne *et al, Arthritis and Rheumatism* (1990) 33, 1023-8]. Other disease areas where tachykinin antagonists are believed to be useful are allergic conditions [Hamelet *et al, Can. J. Pharmacol. Physiol.* (1988) 66, 1361-7], immunoregulation [Lotz *et al, Science* (1988) 241, 1218-21 and Kimball *et al, J. Immunol.* (1988) 141(10), 3564-9] vasodilation, bronchospasm, reflex or neuronal control of the viscera [Mantyh *et al, PNAS* (1988) 85, 3235-9] and, possibly by arresting or slowing

$\beta$ -amyloid-mediated neurodegenerative changes [Yankner *et al*, *Science* (1990) 250, 279-82] in senile dementia of the Alzheimer type, Alzheimer's disease and Down's Syndrome.

Tachykinin antagonists may also be useful in the treatment of small  
5 cell carcinomas, in particular small cell lung cancer (SCLC) [Langdon *et al*, *Cancer Research* (1992) 52, 4554-7].

Substance P may also play a role in demyelinating diseases such as multiple sclerosis and amyotrophic lateral sclerosis [J. Luber-Narod *et al*, poster *C.I.N.P. XVIIIth Congress*, 28th June-2nd July 1992], and in disorders  
10 of bladder function such as bladder detrusor hyper-reflexia (*Lancet*, 16th May 1992, 1239).

It has furthermore been suggested that tachykinins have utility in the following disorders: depression, dysthymic disorders, chronic obstructive airways disease, hypersensitivity disorders such as poison ivy, vasospastic  
15 diseases such as angina and Reynauld's disease, fibrosing and collagen diseases such as scleroderma and eosinophilic fascioliasis, reflex sympathetic dystrophy such as shoulder/hand syndrome, addiction disorders such as alcoholism, stress related somatic disorders, neuropathy, neuralgia, disorders related to immune enhancement or suppression such as systemic  
20 lupus erythmatosus (European patent specification no. 0 436 334), ophthalmic disease such as conjunctivitis, vernal conjunctivitis, and the like, and cutaneous diseases such as contact dermatitis, atopic dermatitis, urticaria, and other eczematoid dermatitis (European patent specification no. 0 394 989).

25 In view of their metabolic instability, peptide derivatives are likely to be of limited utility as therapeutic agents. It is for this reason that non-peptide tachykinin antagonists are sought.

In essence, this invention provides a class of potent non-peptide tachykinin antagonists.

The present invention provides a compound of the formula (I) or a pharmaceutically acceptable salt thereof:

invention include acid addition salts which may, for example, be formed by  
10 mixing a solution of the compound according to the invention with a solution  
of a pharmaceutically acceptable non-toxic acid such as hydrochloric acid,

The invention also provides pharmaceutical compositions comprising  
one or more compounds of this invention in association with a  
25 pharmaceutically acceptable carrier. Preferably these compositions are in  
unit dosage forms such as tablets, pills, capsules, powders, granules,  
solutions or suspensions, or suppositories, for oral, parenteral or rectal  
administration, or topical administration including administration by inhalation  
or insufflation.

The invention further provides a process for the preparation of a pharmaceutical composition comprising a compound of formula (I), or a salt thereof, and a pharmaceutically acceptable carrier, which process comprises bringing a compound of formula (I), or a salt thereof into association with a pharmaceutically acceptable carrier or excipient.

For preparing solid compositions such as tablets, the principal active ingredient is mixed with a pharmaceutical carrier, e.g. conventional tableting ingredients such as corn starch, lactose, sucrose, sorbitol, talc, stearic acid, magnesium stearate, dicalcium phosphate or gums, and other pharmaceutical diluents, e.g. water, to form a solid preformulation composition containing a homogeneous mixture of a compound of the present invention, or a non-toxic pharmaceutically acceptable salt thereof. When referring to these preformulation compositions as homogeneous, it is meant that the active ingredient is dispersed evenly throughout the composition so that the composition may be readily subdivided into equally effective unit dosage forms such as tablets, pills and capsules. This solid preformulation composition is then subdivided into unit dosage forms of the type described above containing from 0.1 to about 500 mg of the active ingredient of the present invention. The tablets or pills of the novel composition can be coated or otherwise compounded to provide a dosage form affording the advantage of prolonged action. For example, the tablet or pill can comprise an inner dosage and an outer dosage component, the latter being in the form of an envelope over the former. The two components can be separated by an enteric layer which serves to resist disintegration in the stomach and permits the inner component to pass intact into the duodenum or to be delayed in release. A variety of materials can be used for such enteric layers or coatings, such materials including a number of polymeric acids and mixtures of polymeric acids with such materials as shellac, cetyl alcohol and cellulose acetate.

The liquid forms in which the novel compositions of the present invention may be incorporated for administration orally or by injection include aqueous solutions, suitably flavoured syrups, aqueous or oil suspensions, and flavoured emulsions with edible oils such as cottonseed oil, sesame oil, coconut oil or peanut oil, as well as elixirs and similar pharmaceutical vehicles. Suitable dispersing or suspending agents for aqueous suspensions include synthetic and natural gums such as tragacanth, acacia, alginate, dextran, sodium carboxymethylcellulose, methylcellulose, polyvinylpyrrolidone or gelatin.

Preferred compositions for administration by injection include those comprising a compound of formula (I), as the active ingredient, in association with a surface-active agent (or wetting agent or surfactant) or in the form of an emulsion (as a water-in-oil or oil-in-water emulsion).

Suitable emulsions may be prepared using commercially available fat emulsions, such as Intralipid™, Liposyn™, Infonutrol™, Lipofundin™ and Lipiphysan™. The active ingredient may be either dissolved in a pre-mixed emulsion composition or alternatively it may be dissolved in an oil (e.g. soybean oil, safflower oil, cottonseed oil, sesame oil, corn oil or almond oil) and an emulsion formed upon mixing with a phospholipid (e.g. egg

phospholipids, soybean phospholipids or soybean lecithin) and water. It will be appreciated that other ingredients may be added, for example glycerol or glucose, to adjust the tonicity of the emulsion. Suitable emulsions will typically contain up to 20% oil, for example, between 5 and 20%. The fat emulsion will preferably comprise fat droplets between 0.1 and 1.0 $\mu$ m, particularly 0.1 and 0.5 $\mu$ m, and have a pH in the range of 5.5 to 8.0.

Compositions in preferably sterile pharmaceutically acceptable solvents may be nebulised by use of inert gases. Nebulised solutions may be breathed directly from the nebulising device or the nebulising device may be attached to a face mask, tent or intermittent positive pressure breathing machine. Solution, suspension or powder compositions may be administered, preferably orally or nasally, from devices which deliver the formulation in an appropriate manner.

For topical administration, for example as a cream, ointment or lotion, pharmaceutically acceptable carriers are, for example, water, mixtures of water and water-miscible solvents such as lower alkanols or arylalkanols, vegetable oils, polyalkylene glycols, petroleum based jelly, ethyl cellulose, ethyl oleate, carboxymethylcellulose, polyvinylpyrrolidone, isopropyl myristate and other conventionally-employed non-toxic, pharmaceutically acceptable organic and inorganic carriers. The compounds may be administered on a regimen of 1 to 4 times per day, preferably once or twice per day.

It will be appreciated that the amount of a compound of formula (I) required for use in any treatment will vary not only with the particular compounds or composition selected but also with the route of administration, the nature of the condition being treated, and the age and condition of the patient, and will ultimately be at the discretion of the attendant physician.

Compounds of formula (IV) are commercially available, or may be prepared by known procedures.

For example, suitable methods for the preparation of compounds of  
15 formula (IV) are described in European Patent Application no. 0 337 167, *J. Am. Chem. Soc.*, 81, 1201 (1959), *J. Med. Chem.*, 17, 453 (1974) and *J. Med. Chem.*, 24, 218 (1981).

In general, compounds of formula (IV) wherein  $R^3$  is H,  $R^{40}$  is alkoxy and n is 1 or 2 may be prepared by cyclisation of an intermediate of formula  
20 (V)

wherein  $R^2$ ,  $R^{40}$ , n and m are as previously defined, and Hal represents  
25 halo, for example, chloro or bromo, in the presence of a reducing agent such

as hydrogen in the presence of a catalyst such as platinum oxide or palladium on charcoal.

The reaction is conveniently effected in a suitable organic solvent, such as an ether, for example, tetrahydrofuran.

5 Analogous methods may be used to produce compounds of the formula (IV) substituted by A<sup>1</sup> and A<sup>2</sup> wherein A<sup>1</sup> and A<sup>2</sup> are as defined in relation to formula (II).

Intermediates of formula (V) may be prepared by reaction of compounds of formula (VI) with compounds of formula (VII)

10

15

wherein R<sup>2</sup>, R<sup>40</sup>, n, m and Hal are as previously defined, in the presence of a base. Analogues of the compounds of formula (V) containing groups A<sup>1</sup> and A<sup>2</sup> as previously defined may be prepared in analogous manner.

20

Suitable bases of use in the reaction include alkali metal hydrides, such as, for example, sodium hydride. The reaction is conveniently effected in a suitable organic solvent, such as an ether, for example, tetrahydrofuran, suitably at elevated temperature, such as the reflux temperature of the chosen solvent.

Compounds of formulae (VI) and (VII) are commercially available, or may be prepared from commercially available starting materials using conventional procedures well known to those skilled in the art.

25

Compounds of formula (IV) wherein R<sup>40</sup> is alkoxy and n is other than zero may in general be prepared from the corresponding compounds of formula (VIII)

wherein A<sup>1</sup>, A<sup>2</sup>, R<sup>3</sup>, R<sup>40</sup> and m are as previously defined and n is 1 or 2 by  
 5 treatment with a base and reaction of the resulting nucleophile with a reagent  
 suitable to introduce the group R<sup>2</sup>, such as an activated aryl moiety, for  
 example:

10

wherein R<sup>x</sup> is H or halo, such as chloro; an aryl iodide in the presence of  
 nickel bromide (*J. Am. Chem. Soc.*, 99, 4833 (1977)); or a hypervalent  
 aryl iodide (*Synthesis*, 709 (1984)).

Compounds of formula (VIII) may be prepared from the corresponding  
 15 intermediates of formula (IX)

wherein  $A^1$ ,  $A^2$ ,  $R^3$ ,  $m$  and  $n$  are as defined for formula (VIII) by conventional methods, for example, by sequential reaction with lithio-2-trimethylsilyl-1,3-dithiane and an alcohol of formula  $R^{40}H$ , where  $R^{40}$  is alkoxy, in the presence of an acid, such as a mineral acid, for example, hydrochloric acid.

5 Still further procedures suitable for the preparation of compounds of formula (IV) will be readily apparent to those skilled in the art.

Compounds of the formula (I) wherein  $R^3$  and  $R^5$  are hydrogen may also be prepared from a corresponding compound of the formula (X):

10

wherein  $A^1$ ,  $A^2$ ,  $R^1$ ,  $R^2$ ,  $R^6$ ,  $R^7$ ,  $X$ ,  $m$  and  $n$  are as defined in relation to formula (I), and  $R^{31}$  is a protecting group and any reactive group is protected, by conventional processes followed by deprotection if required.

15 Most aptly the compound of the formula (X) is one in which  $R^{31}$  represents a protecting group such as t-butoxycarbonyl.

Similarly, for compounds of the formula (X) in which  $X$  is not oxygen,  $X$  preferably represents a protected amino group, such as a t-butoxycarbonyl protected amino group.

20 Thus for example for compounds wherein  $R^4$  is  $CH_2OH$ , the compound of the formula (X) may be treated with a borane such as  $BH_3$ , in a suitable solvent such as tetrahydrofuran, followed by treatment with a peroxide, for example hydrogen peroxide, in the presence of a base, such as sodium hydroxide.

Compounds wherein  $R^4$  is  $\text{CH}_2\text{OH}$  may be converted into compounds wherein  $R^4$  is  $(\text{CH}_2)_p\text{OR}^{16}$  where  $p$  is 1 and  $R^{16}$  is as defined in relation to formula (I) by reaction with a halide of the formula  $R^{16}\text{Hal}$ , where Hal is as previously defined, in the presence of a suitable base such as sodium hydride.

A group of particularly suitable intermediates may be represented by formula (XI):

wherein  $R^1$ ,  $R^2$ ,  $R^6$ ,  $R^7$ ,  $X$ ,  $n$  and  $m$  are as defined in relation to formula (I) and PG represents a protecting group and in particular t-butoxycarbonyl.

The  $\text{CH}_2\text{BH}_2$  moiety may be converted into  $R^4$  groups by known methods.

Compounds of the formula (I) wherein  $R^3$  and  $R^5$  are hydrogen,  $X$  is O or S and  $R^4$  is a  $\text{CO}_2\text{R}^{16}$  group can be prepared by reaction of a compound of the formula (XII) with one of formula (XIII):

31

(XII)

(XIII)

wherein A<sup>1</sup>, A<sup>2</sup>, R<sup>1</sup>, R<sup>2</sup>, R<sup>6</sup>, R<sup>7</sup>, m and n are as defined in relation to formula (I), X is O or S, R<sup>31</sup> is a protecting group and R<sup>40</sup> is a C<sub>1-6</sub>alkyl group or a readily removable group. The reaction is effected in the presence of a catalyst such as rhodium(II)acetate in a suitable solvent, for example, a hydrocarbon such as toluene at elevated temperature, conveniently at reflux. Thereafter, R<sup>31</sup> may be replaced by H and, if desired, the readily removable ester may be replaced by H or a salting ion in conventional manner. The CO<sub>2</sub>R<sup>40</sup> group may also be converted to other R<sup>4</sup> groups by known methods.

Another group of particularly useful intermediates may be represented by formula (XIV):

(XIV)

15

wherein  $R^1$ ,  $R^2$ ,  $R^6$ ,  $R^7$ ,  $X$ ,  $n$  and  $m$  are as defined in relation to formula (I) and PG represents a protecting group and in particular t-butoxycarbonyl.

The  $\text{CO}_2\text{CH}_3$  moiety may be converted into other  $R^4$  groups by known methods. Thus, for example, reaction with a Grignard reagent of formula  $R^c\text{MgHal}$  where  $R^c$  is an alkyl group and Hal is as previously defined will  
5 give compounds where  $R^4$  is a tertiary alcohol. Secondary alcohols may be prepared firstly by reduction of the ester moiety to an aldehyde using, for example, diisobutylaluminium hydride, followed by reaction with either  $R^c\text{Li}$  or  $R^c\text{MgHal}$ .

10 The aldehyde may also be used as a precursor for alkenyl intermediates where the group at position  $R^4$  has the formula  $-\text{CH}=\text{CHR}^d$ , where  $R^d$  is  $(\text{CH}_2)_s\text{NR}^{10}\text{R}^{11}$ ,  $(\text{CH}_2)_s\text{CO}_2\text{R}^{16}$ ,  $(\text{CH}_2)_s\text{CONR}^{10}\text{R}^{11}$  or  $(\text{CH}_2)_s\text{NR}^{10}\text{COR}^{18}$  (where  $s$  is 0, 1 or 2 and  $R^{10}$ ,  $R^{11}$  and  $R^{18}$  are as previously defined). These compounds may be prepared by a Wittig reaction  
15 using, for example,  $\text{Ph}_3\text{P}=\text{CHR}^d$  or  $(\text{EtO})_3\text{P}(\text{O})=\text{CHR}^d$ . These alkenyl intermediates may be reduced using, for example, catalytic hydrogenation to give compounds wherein  $R^4$  is  $(\text{CH}_2)_p\text{NR}^{10}\text{R}^{11}$ ,  $(\text{CH}_2)_p\text{CO}_2\text{R}^{16}$ ,  $(\text{CH}_2)_p\text{CONR}^{10}\text{R}^{11}$  or  $(\text{CH}_2)_p\text{NR}^{10}\text{COR}^{18}$  and  $p$  is 2 to 4.

Compounds wherein  $R^4$  is  $\text{CONR}^{10}\text{R}^{11}$  may be prepared by the  
20 reaction of a compound of formula (XIV) with an amine of the formula  $\text{HNR}^{10}\text{R}^{11}$  by known methods. Subsequent reduction using, for example, borane in tetrahydrofuran may be used to give a compound wherein  $R^4$  is  $(\text{CH}_2)_p\text{NR}^{10}\text{R}^{11}$  in which  $p$  is 1. Where one or both of  $R^{10}$  and  $R^{11}$  in the resultant amine is a hydrogen atom, the amine may be further converted into  
25 a compound wherein  $R^4$  is  $(\text{CH}_2)_p\text{NR}^{10}\text{COR}^{18}$  by reaction with, for example, an acyl chloride of the formula  $\text{R}^{16}\text{COCl}$  by known methods.

If a compound of the formula (I) is required in which  $R^5$  is an alkyl group it may be prepared via a corresponding compound of the formula (I) in which  $R^4$  is  $\text{CO}_2\text{R}^{40}$  group by reaction with KHMDS and an alkyl iodide,

followed if desired by replacement of a readily removable group  $R^{40}$  by H or a salting ion. The  $CO_2R^{40}$  may also be converted to other  $R^4$  groups by known methods.

Intermediates of formula (II) wherein  $R^{30}$  is  $NR^{19}$  and  $R^6$  and  $R^7$  are hydrogen may be prepared by reduction of a corresponding compound of the formula (XV):

wherein  $R^2$ ,  $R^3$ ,  $A^1$ ,  $A^2$ ,  $n$  and  $m$  are as defined in relation to formula (II).

The reduction may be effected using a reducing agent such as lithium aluminium hydride in order to produce a compound in which  $R^{19}$  is hydrogen (which in general is preferred). This may be followed by reductive amination to produce a compound in which  $R^{19}$  is a  $C_{1-4}$ alkyl group in conventional manner.

Compounds of the formula (XV) can be prepared from the corresponding halo compound by reaction with, for example, KCN using known methods. Such halo compounds are either commercially available or may be prepared in an analogous manner to commercial compounds.

Intermediates of formula (II) wherein  $R^{30}$  is OH and  $R^6$  and  $R^7$  are hydrogen have the general formula (XVI):

34

wherein A<sup>1</sup>, A<sup>2</sup>, R<sup>2</sup>, R<sup>3</sup>, n and m are as defined in relation to formula (I).

These compounds may be prepared by reduction of a corresponding  
 5 compound of the formula (XVII):

using lithium aluminium hydride in conventional manner. Most aptly the  
 10 reduction is performed on a compound of the formula (XVI) in which R<sup>3</sup> is  
 hydrogen. After reduction R<sup>3</sup> is aptly replaced by a t-butoxycarbonyl group  
 which acts as a favoured protecting group.

Compounds of the formula (XVII) wherein R<sup>3</sup> is hydrogen may be  
 obtained commercially or prepared in an analogous manner to commercial  
 15 compounds.

Compounds of formula (X) may be prepared from a corresponding  
 compound in which the =CH<sub>2</sub> moiety is an =O group, by reaction with  
 dimethyltitanocene in toluene according to the method of N. A. Petasis *et al*,  
*J. Am. Chem. Soc.*, (1990) 112(17), 6392. Alternatively, titanium  
 20 tetrachloride/zinc dust/tetrahydrofuran/dichloromethane may be used  
 according to the method of P. Kocienski and M. Mortimore, *Tet. Lett.*, (1988)

29(27), 3375. When X is an oxygen atom, this ester precursor may be prepared by conventional methodology from an alcohol of formula (XVI) and an appropriate benzoic acid derivative in the presence of a suitable coupling agent such as 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride and a base such as 4-dimethylaminopyridine. The reaction is conveniently effected in a solvent such as dimethylformamide.

It will be appreciated that a mixture of diastereomers may be resolved by methods known in the art. Thus, for example, an intermediate of formula (XIV) may be resolved by the preparation of a chiral auxiliary using, for instance, (R)-4-benzyl-2-oxazolidone. Following resolution by, for example, chromatography, the oxazolidone moiety may be removed using a reducing agent such as lithium borohydride to yield compounds wherein R<sup>4</sup> is CH<sub>2</sub>OH and R<sup>5</sup> is H. The less favoured diastereomer may be isomerised to give a further mixture of diastereomers and the resolution procedure repeated.

During any of the above synthetic sequences it may be necessary and/or desirable to protect sensitive or reactive groups on any of the molecules concerned. This may be achieved by means of conventional protecting groups, such as those described in *Protective Groups in Organic Chemistry*, ed. J.F.W. McOmie, Plenum Press, 1973; and T.W. Greene and P.G.M. Wuts, *Protective Groups in Organic Synthesis*, John Wiley & Sons, 1991. The protecting groups may be removed at a convenient subsequent stage using methods known from the art.

The exemplified compounds of this invention were tested by the methods set out at pages 36 to 39 of International Patent Specification No. WO 93/01165. The compounds were found to be active with IC<sub>50</sub> at the NK1 receptor of less than 150nM.

The compounds of this invention may be formulated as specifically illustrated at pages 35 to 36 of International Patent Specification No. WO 93/01165.

The following non-limiting examples serve to illustrate the present invention:

#### EXAMPLE 1

a)     1-tert-Butoxycarbonyl-4-phenyl-4-hydroxymethylpiperidine

4-Phenyl-4-carboxy piperidine tosylate (10g) was added portionwise to a  
10     solution of lithium aluminium hydride (1.52g) in dry tetrahydrofuran (100ml) at  
0°C. After addition was complete the reaction mixture was warmed to reflux  
for 30 minutes and then allowed to cool to room temperature. The reaction  
was then quenched by addition of 2N sodium hydroxide solution until a white  
granular precipitate formed. The mixture was filtered and the filtrate  
15     extracted with ethyl acetate (200ml), dried (MgSO<sub>4</sub>), filtered and solvent  
removed to afford a clear oil. The residual oil was taken up in  
dichloromethane (50ml) and di-*tert*-butyl-dicarbonate (1.9g) added. The  
resulting mixture was stirred at room temperature for 18 hours. The solvent  
was removed and the residual oil subjected to chromatography on silica gel

Titanium tetrachloride (1.06g) was added to cooled ( $0^\circ\text{C}$ ) stirred tetrahydrofuran under a dry nitrogen atmosphere. After the exotherm had subsided the solution was allowed to warm to room temperature and tetramethylethylene diamine (1.69g) added followed 15 minutes later by freshly activated zinc dust (819mg). The resulting mixture was stirred for 30 minutes at room temperature at which point dibromomethane (0.21ml) and the compound of step (b) above (716mg) were added. The reaction was allowed to proceed for 18 hours at room temperature. After this time the reaction was quenched with saturated  $\text{K}_2\text{CO}_3$  (7ml) and diluted with diethyl ether. The resulting black suspension was filtered through a plug of grade III neutral alumina, eluting with 1% triethylamine/diethyl ether. The filtrate was dried over  $\text{MgSO}_4$ , filtered and the solvent removed under reduced pressure. The residual oil was purified by chromatography on silica gel (10% ethyl acetate/ n-hexane) to afford the title compound.  $^1\text{H}$  NMR (360MHz,  $\text{CDCl}_3$ )  $\delta$  1.2 (9H, s), 1.95 (2H, m), 2.38 (2H, m), 3.05 (2H, m), 3.8 (2H, s), 3.95 (2H, m), 4.21 (1H, d,  $J=1.0\text{Hz}$ ), 4.63 (1H, d,  $J=1.0\text{Hz}$ ), 7.1-7.3 (5H, m), 7.7 (1H, s), 7.76 (2H, s).

A mixture of 4N NaOH (10ml) and  $\text{H}_2\text{O}_2$  (5ml of a 29% solution in water) was added and the reaction stirred for 3 hours, then extracted with diethyl ether. The ethereal extracts were washed with sodium bisulphite solution then dried ( $\text{Na}_2\text{SO}_4$ ) and concentrated. The residue was purified by chromatography on silica gel eluting with ethyl acetate-petroleum ether (3:7) to give the title compound as a colourless oil.

e) 4-Phenyl-4-((1-(3,5-bis(trifluoromethyl)phenyl)-2-hydroxyethoxy)methyl)piperidine Hydrochloride
